MC simulations on grid infrastructure with GATE-Lab

GATE v6 [Jan11]

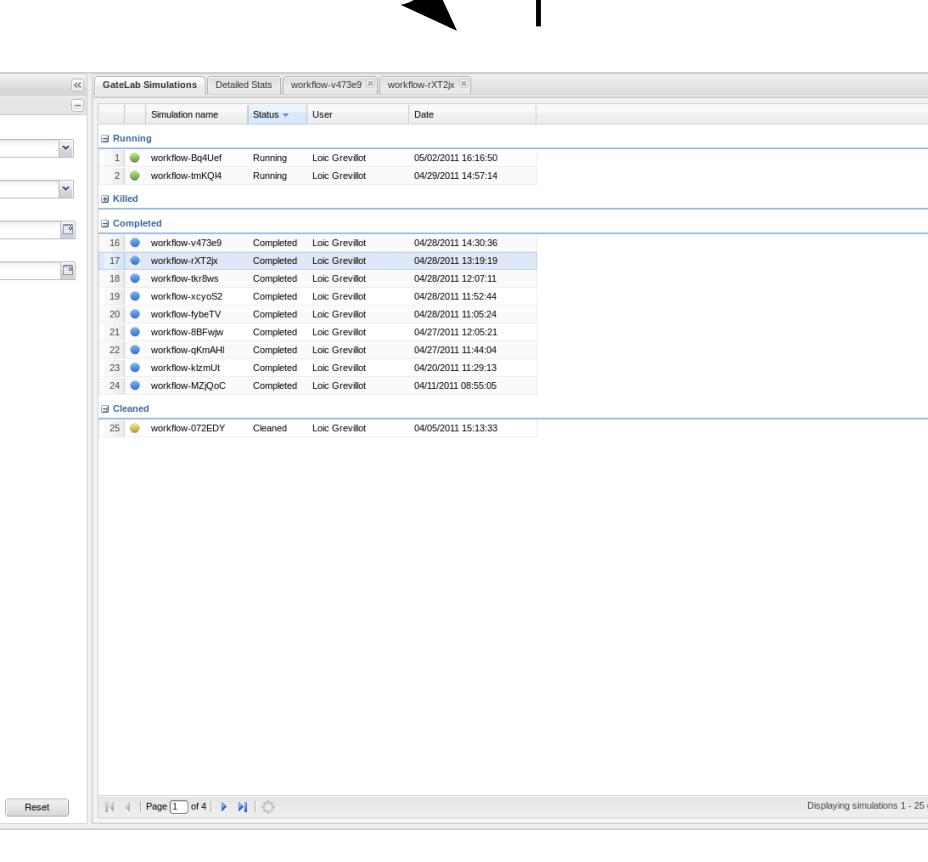

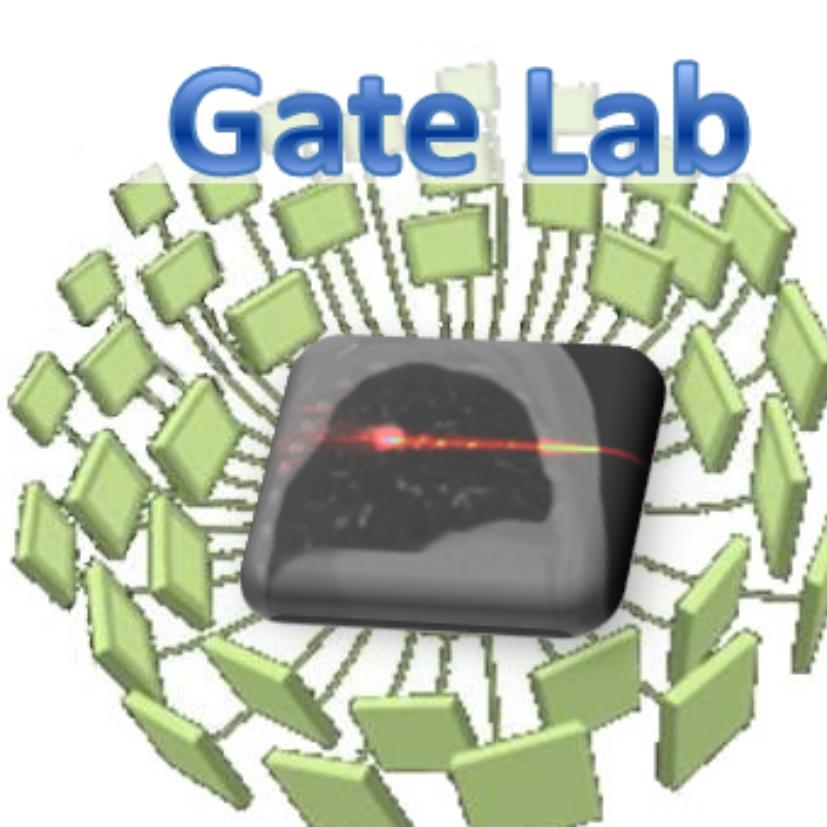

- multi-purpose MC code
- Geant4 based
- patient geometry (CT)
- TP (Treatment Plan) irradiation
- realistic sources & imaging devices
- highly compute-intensive
- straightforward parallelization

Grid computing

- important amount of computing resources
- usability gap between users and platform

GATE-Lab is a user friendly platform which allows users to launch **Gate** simulations on the EGI grid infrastructure and local clusters.

speed up MC simulations for hadrontherapy R&D

Versatile outputs

- dose & deposited energy map
- phase space
- production and stopping rate
- filter on type, energy, direction ...

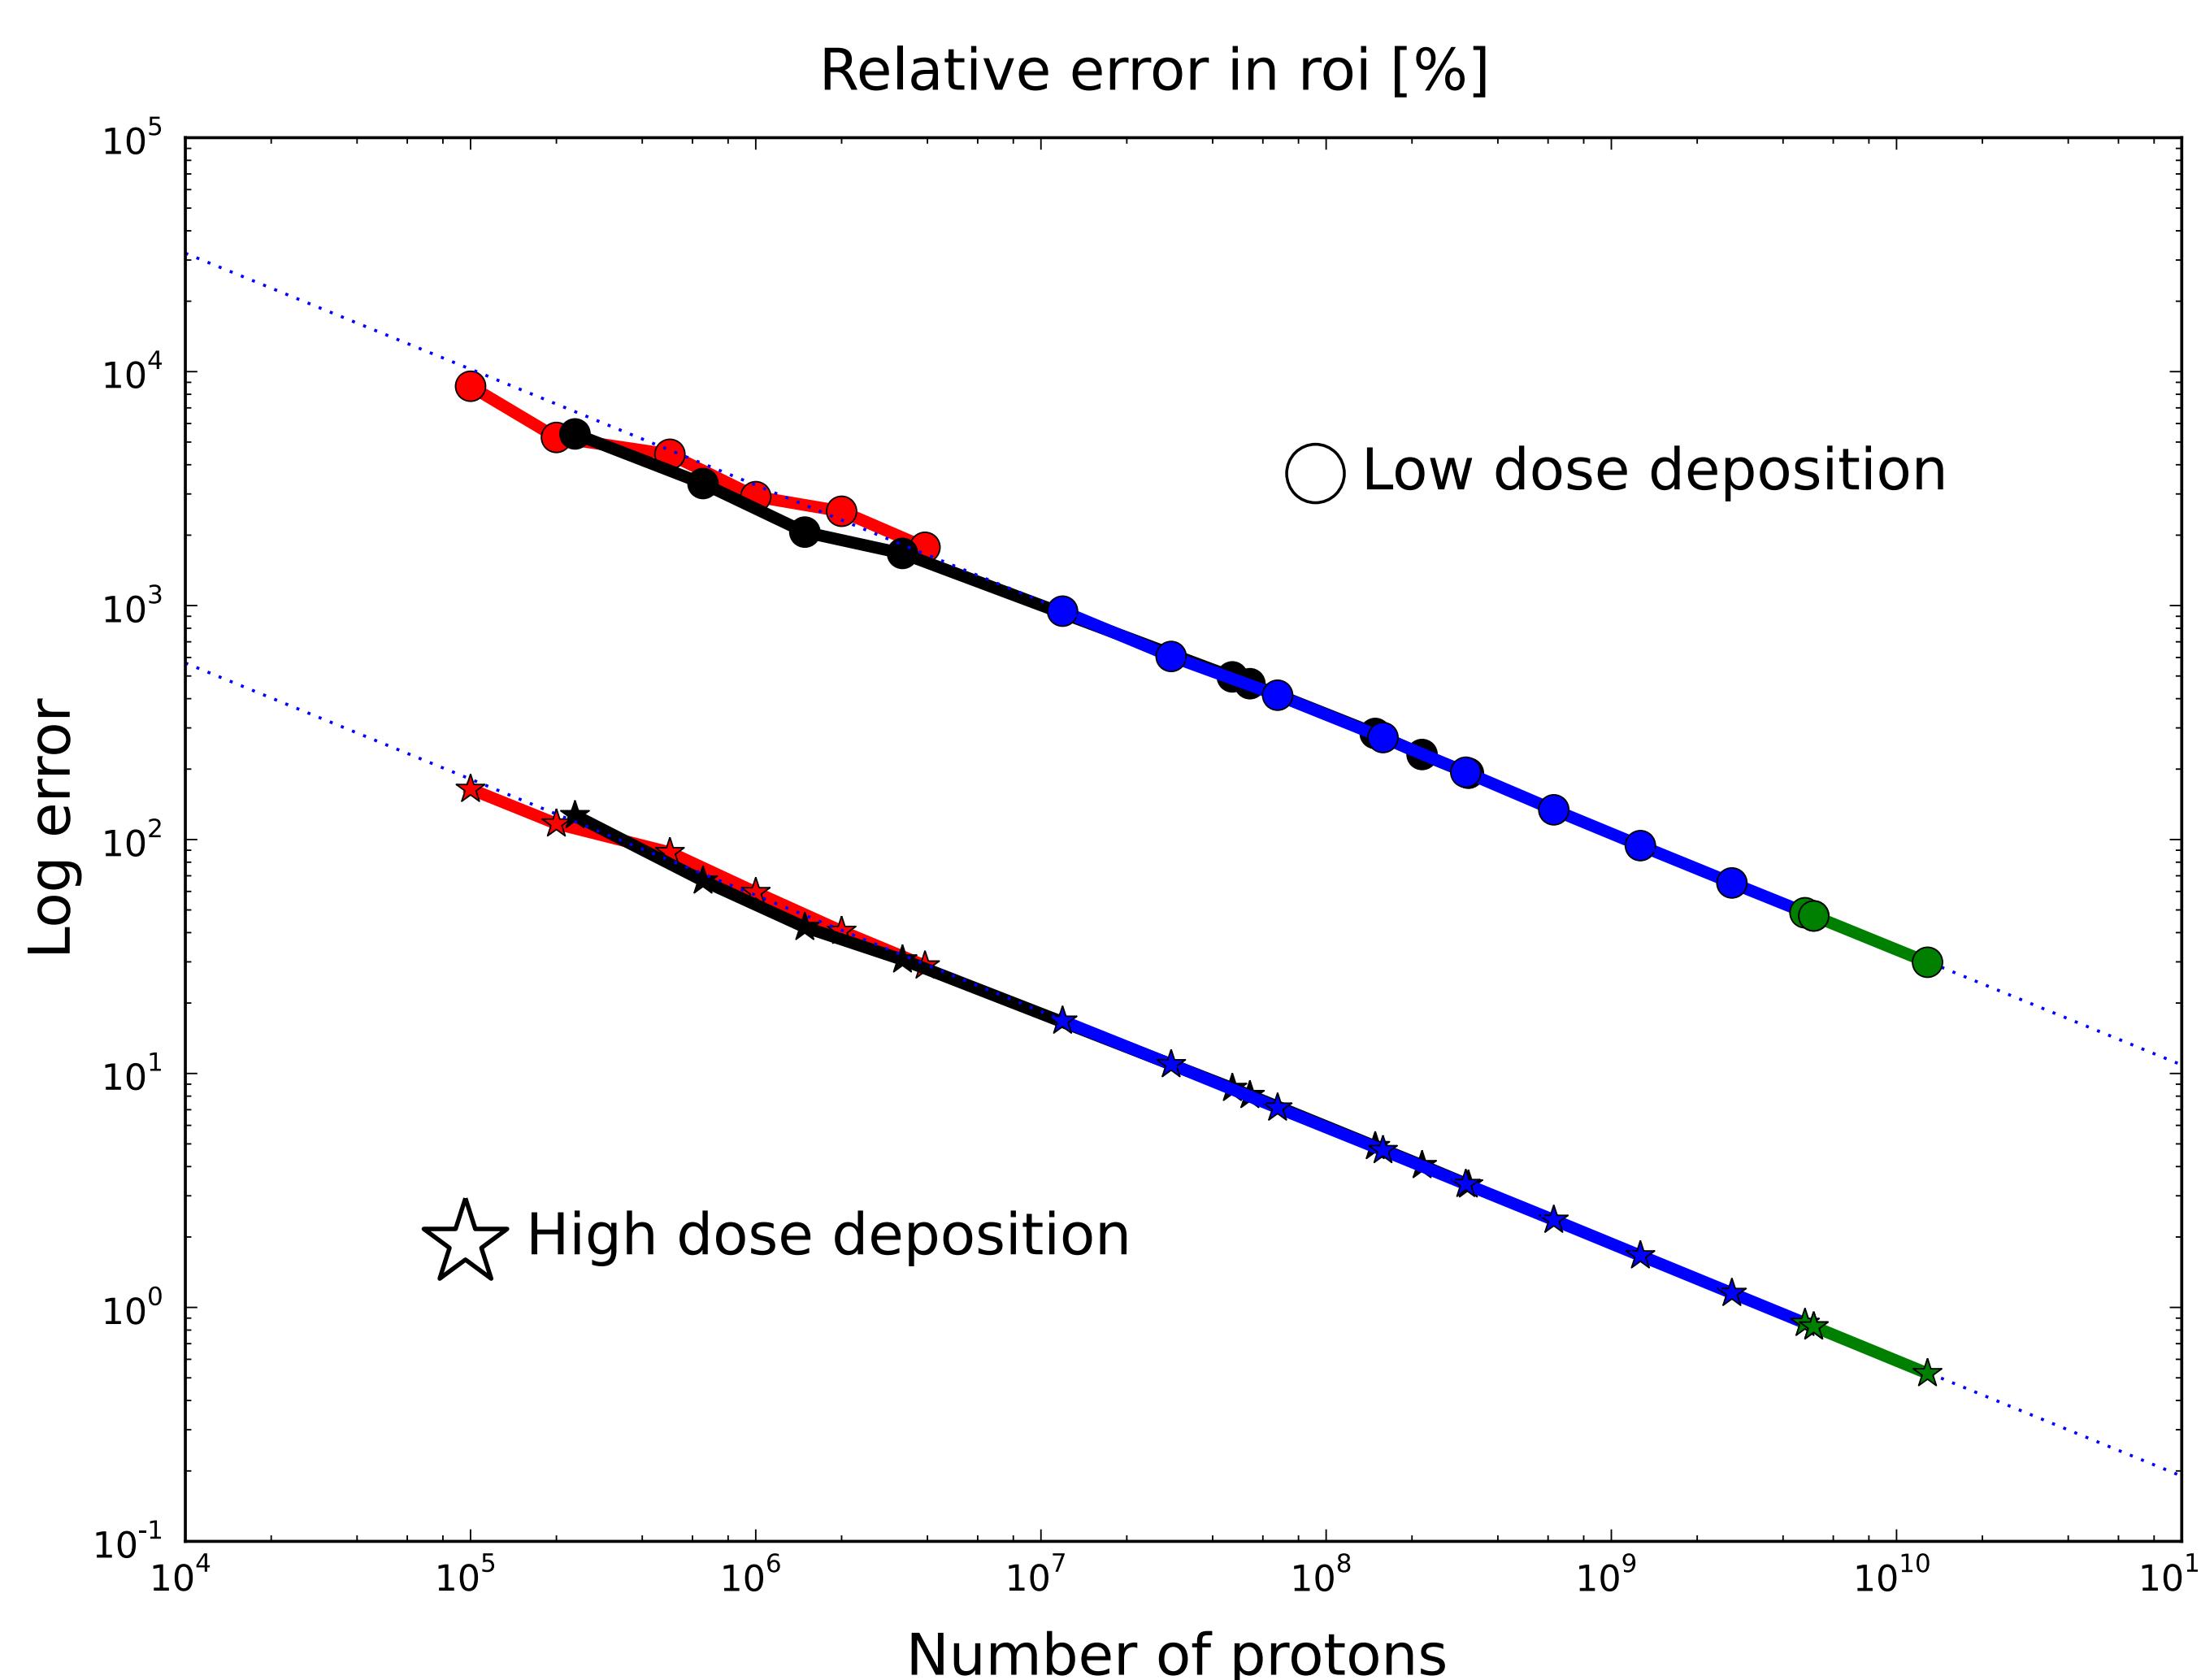

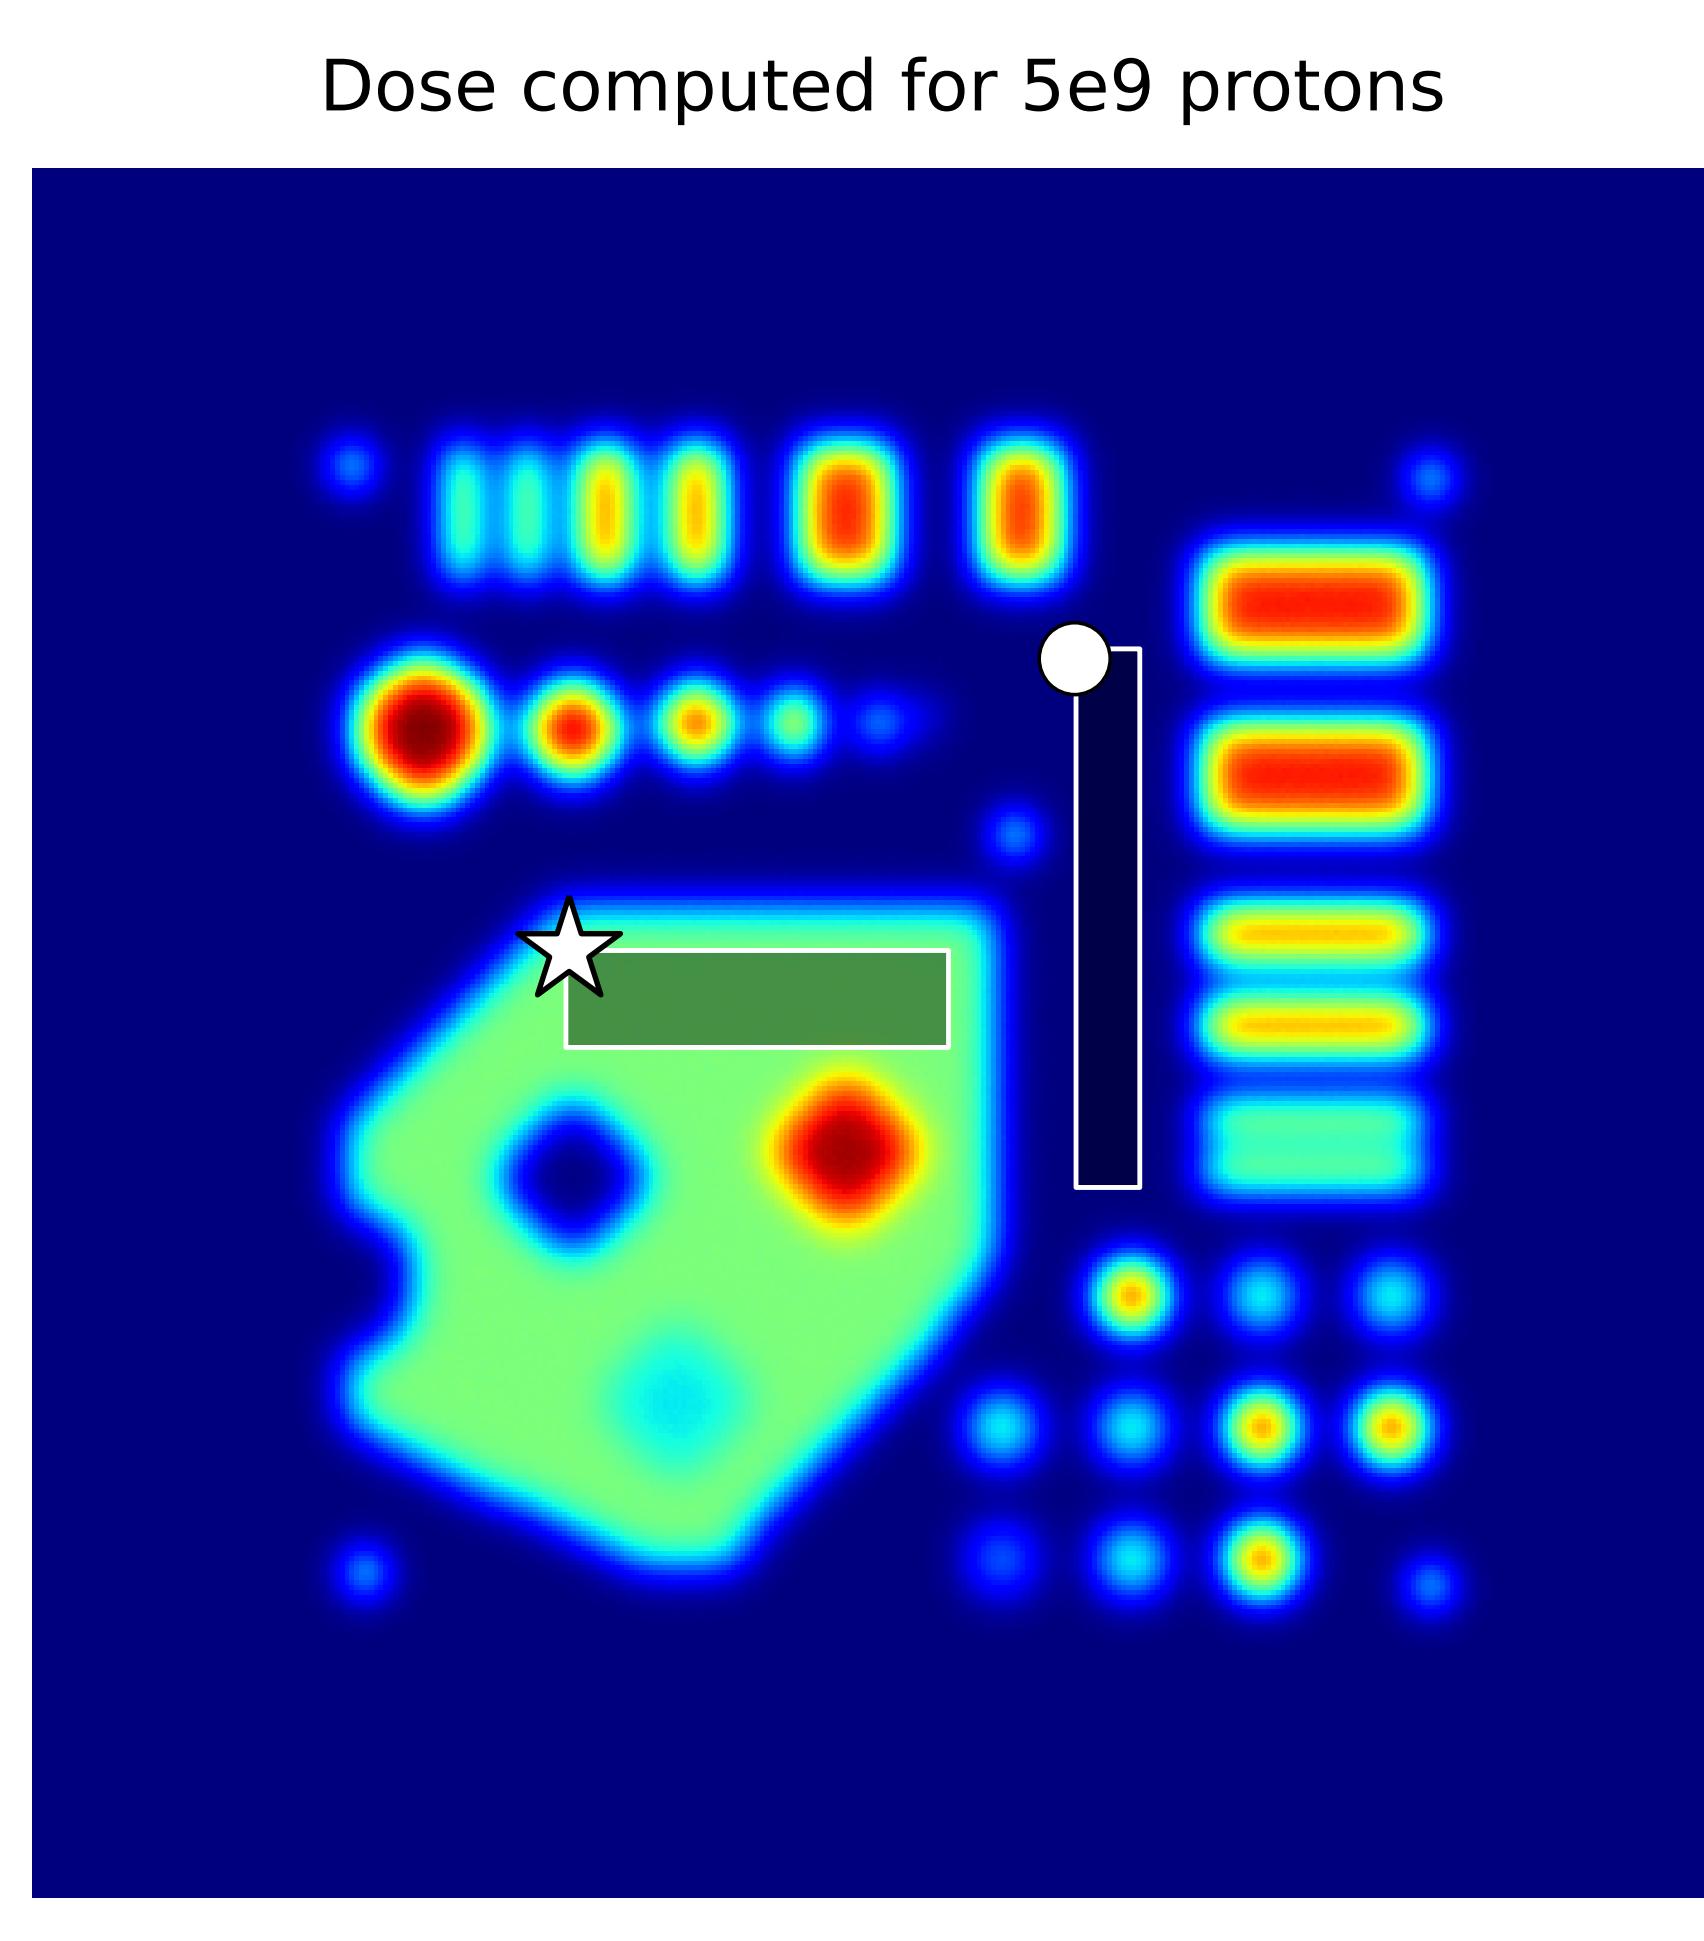

GATE-Lab Features

- user-friendly web interface
- flexible output formats
- automatic deployment & merging
- dynamic load balancing [**Pop10**]
- error handling / job resubmission

Quality assurance

- robust & simple macro description
- tested releases & physic lists
- dose validated versus TPS [**Grevillot10**]
- flexible source & geometry description

Active scanning proton test pattern from TP

- Pencil Beam Scanning (PBS)
- TP generated with Xio (Elekta)
- IBA test pattern
- realistic source
- 3000 spots
- 120 MeV to 180 MeV proton TP

- 2.5 cGy → 5⁹ protons
- 0.8 % uncertainty in 0.125 mm³
- 2 months on 1 CPU
- 7h20 with 250 grid jobs
- deployment and merge included

189 times faster than simple CPU simulation

Perspectives

- private cluster deployment
- large phsp management (>2GB)
